

SOP updates

1. The use of footpedal for CAP 2 rewind control
2. Secondary operator roles (stand at the panel and take care of other process details
3. Machine pauses are being recorded.
4. Posting after each role rather than waiting
5. Operators must ensure that the belts do not stop by continuously wrapping and taking off and setuping up rolls within 2 minutes 30 seconds
6. East end operator must continuously check on paper wraps to prevent it from being sucked up by the belts
7. Operators must meet hourly targets and shift targets
8. Supplies button must be used in anticipation of need to prevent or reduce downtime due to waiting for supplies or bin change

Production Calculator and rates

Purpose of the project

Establish production baseline current

Create realistic production target

Create plan to meet production target

Product Types

Lengths 15 25 54

Lengths of the product can affect the productivity

When are the brown sheets used in production, why are they used? For protecting the belts from glue. How long does it take to change and how often does it get changed? That affects the speed

Operator Idle Time

During product rolling

Length of product	Time to Roll a Product
15	7.5
25	
54	

Sequence

1. Wrapped product is lifted from the rewind rolls and put on the racks
2. Over flowing material is wrapped around the cardboard roll inserts and placed in the rewind rolls
3. Operators exit the light curtains and reset the panel
4. Pull roll begins to roll
5. Dancer rolls lifts of its lower limit and belts start

IMPROVEMENT PLAN

Set Realistic targets for the different rolls

Reasons for stops and delays

1. When belts are not reset or started on time after a roll is complete
2. Faults and alarms
3. Pallet Change
4. Offcut bin change
5. Scrapping paper sheet at belt exit
6. Roll changes
